1. Answer-Conditioned Chains of Thought Degrade Verifiable-Reasoning Distillation in Large Language Models

Source: arXiv (research_paper)

Novelty: 6.0/10 | **Relevance:** 0

Summary: Answer-Conditioned Chains of Thought Degrade Verifiable-Reasoning Distillation in Large Language Models. A standard recipe for distilling the reasoning ability of large language models (LLMs) is to sample chains of thought from the model, keep those that reach the correct final answer, and fine-tune on the survivors. When sampling fails, a common fix shows the generator the gold answer and asks it to write a chain that reaches that answer. We show that this second step degrades the training data

2. Latent Trajectory Discrimination for AI-Generated Text Detection

Source: arXiv (research_paper)

Novelty: 6.0/10 | **Relevance:** 20

Summary: Latent Trajectory Discrimination for AI-Generated Text Detection. Most existing approaches to AI-Generated Text Detection (AIGTD) treat documents as static objects and base their decisions on aggregate statistics or globally compressed embeddings. However, this perspective overlooks the inherently dynamic nature of autoregressive generation, where content evolves progressively through the latent space. In this paper, we reformulate AIGTD as the problem of distinguishing between latent generation

3. The Misclassification of Autistic Writing as AI-Generated

Source: arXiv (research_paper)

Novelty: 6.0/10 | **Relevance:** 40

Summary: The Misclassification of Autistic Writing as AI-Generated. Recent findings suggest that detection models for artificial intelligence (AI) cannot accurately identify AI-generated text and may exhibit bias against certain minority groups. In the present study, anecdotal claims that autistic writers more often have their work flagged as AI-generated are examined empirically. A corpus of approximately 60,000 Reddit posts split into "likely-autistic" and "general-Reddit" subcorpora is used to compare

4. Transparency In The reporting of Artificial INtelligence - the TITAN guideline

Source: Semantic Scholar (research_paper)

Novelty: 6.0/10 | **Relevance:** 40

Summary: Transparency In The reporting of Artificial INtelligence - the TITAN guideline. The use of AI in research and the literature is increasing. The need for transparency is clear. Here we present a guideline to transparently reporting the use of AI in any manuscript in general. The guideline items cover; declaration, purpose and scope, AI tools and configuration, data inputs and safeguards, human oversight and verification, bias, ethics and regulatory compliance and reproducibility and transparency.

5. Is Self-knowledge and Action Consistent or Not: Investigating Large Language Model's Personality

Source: Papers with Code (research_paper)

Novelty: 6.0/10 | **Relevance:** 0

Summary: Is Self-knowledge and Action Consistent or Not: Investigating Large Language Model's Personality. In this study, we delve into the validity of conventional personality questionnaires in capturing the human-like personality traits of Large Language Models (LLMs). Our objective is to assess the congruence between the personality traits LLMs claim to possess and their demonstrated tendencies in real-world scenarios. By conducting an extensive examination of LLM outputs against observed human respon

6. Artificial intelligence, firm growth, and product innovation

Source: OpenAlex (research_paper)

Novelty: 6.0/10 | **Relevance:** 40

Summary: Artificial intelligence, firm growth, and product innovation. We study the use and economic impact of AI technologies. We propose a new measure of firm-level AI investments using employee resumes. Our measure reveals a stark increase in AI investments across sectors. AI-investing firms experience higher growth in sales, employment, and market valuations. This growth comes primarily through increased product innovation. Our results are robust to instrumenting AI investments using firms' exposure

8. Making Large Language Models Better Reasoners with Alignment

Source: Papers with Code (research_paper)

Novelty: 6.0/10 | **Relevance:** 20

Summary: Making Large Language Models Better Reasoners with Alignment. Reasoning is a cognitive process of using evidence to reach a sound conclusion. The reasoning capability is essential for large language models (LLMs) to serve as the brain of the artificial general intelligence agent. Recent studies reveal that fine-tuning LLMs on data with the chain of thought (COT) reasoning process can significantly enhance their reasoning capabilities. However, we find that the fine-tuned LLMs suffer from an \tex

44. Multi-Model Synthetic Training for Mission-Critical Small Language Models

Source: Papers with Code (research_paper)

Novelty: 6.0/10 | **Relevance:** 20

Summary: Multi-Model Synthetic Training for Mission-Critical Small Language Models. Large Language Models (LLMs) have demonstrated remarkable capabilities across many domains, yet their application to specialized fields remains constrained by the scarcity and complexity of domain-specific training data. We present a novel approach that achieves a 261x cost reduction for maritime intelligence by using LLMs as one-time teachers rather than using them directly for inference. Our method transforms 3.2 billion

Source: Papers with Code (research_paper)

Novelty: 6.0/10 | **Relevance:** 0

Summary: PruneVid: Visual Token Pruning for Efficient Video Large Language Models. In this paper, we introduce PruneVid, a visual token pruning method designed to enhance the efficiency of multi-modal video understanding. Large Language Models (LLMs) have shown promising performance in video tasks due to their extended capabilities in comprehending visual modalities. However, the substantial redundancy in video data presents significant computational challenges for LLMs. To address this issue, we introdu

36. A Gentle Introduction to Autoencoders & Latent Space

Source: Towards Data Science (blog)

Novelty: 6.0/10 | **Relevance:** 20

Summary: A Gentle Introduction to Autoencoders & Latent Space. Introduction Heavy computation is a well-known problem in various ML algorithms today, especially when generative AI is applied to text, images, and other unstructured data. One of the principal approaches to mitigate this problem is to compress input data into a lower-dimensional representation while preserving the main context. There are various methods that achieve this [...] The post A Gentle Introduction to Autoencoders & Latent Space appe

37. Context Engineering Isn't Enough - A Loop Engineering Experiment With No LLM Inside the Loop

Source: Towards Data Science (blog)

Novelty: 6.0/10 | **Relevance:** 0

Summary: Context Engineering Isn't Enough - A Loop Engineering Experiment With No LLM Inside the Loop. Everyone is talking about loop engineering, but most discussions assume an LLM sits at the center of the loop. I wanted to isolate the architecture itself. So I built a deterministic, zero-dependency Python benchmark that replaces the model with simple rules, allowing me to measure one question directly: can a goal-directed controller isolate failures better than a traditional linear pipeline? After val

38. Brex built its AI agent policy by watching what agents actually do, not by writing rules first

Source: RSS Feeds (blog)

Novelty: 6.0/10 | **Relevance:** 40

Summary: Brex built its AI agent policy by watching what agents actually do, not by writing rules first. OpenClaw has become one of the most widely adopted agentic frameworks, but it has yet to prove itself at enterprise scale. Agents need real credentials - API keys, OAuth tokens, service accounts - to work effectively, and Brex found that traditional guardrails couldn't contain what those agents were doing with them. Brex set out to overcome these limitations by building an internal platform it calls C
